

# HTML3a: CSS Modularity - Part I

## Skills

- CSS Architecture
- Problem-solving

## Resources

- [CSS 2.1 Reference](#)
- [LearnLayout](#)

## Requirements

1. Write the CSS necessary to render the following components (see screenshots below). Use the given [starter code](#).
  - data table
  - stats
  - bar chart
  - lightbox
  - media block
2. **Important: Do not modify the HTML other than to add ids and classes.**
3. Your CSS must meet the following requirements:
  - Must work on different types of elements (not dependent on tagname)
  - Must not affect other elements of the same type
  - Must work in nested hierarchies (e.g. a list within a list; styles should not break)
  - Must not be location specific (can be applied to similar elements on different pages/sections of the site)

4. Style the given HTML to match the following screenshot. It doesn't need to be pixel perfect (just eyeball it) but it should be *close*, with color, font, layout, and spacing properly accounted for.

## 1. Data Table

Style a table full of data so that it looks nicer than the browser defaults.

0	Sean	Daaken	@seandaken
1	Raine	Laurie	@metaraine
2	Matt	Null	@nulltemple

It should also handle header rows...

#	First Name	Last Name	Username
0	Sean	Daaken	@seandaken
1	Raine	Laurie	@metaraine
2	Matt	Null	@nulltemple

## 2. Stats

Three columns, three prominent numbers, three small labels

7	59	28
followers	scored	collected

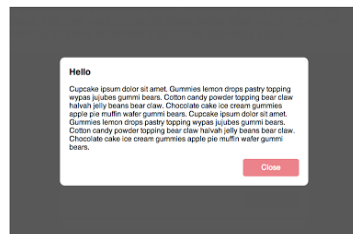

## 3. Bar Chart

Bar widths are set in the HTML as if they were populated from the back-end. Everything else should be styled with CSS.

## 4. Lightbox

The lightbox should display arbitrary content, centered vertically and horizontally, with everything behind it (the rest of the page) darkened. It should obscure the entire screen, no matter where you are on the page. You may want to disable these styles when you're not actively working on them, otherwise they'll cover the whole page.

## 5. Media Block

A media block is a left-floated image with some content beside it. Think Facebook updates.

Does it work with a different html structure?

How about nested media objects?
